

Cultivator Tynes

Cultivator tynes, commonly referred to as cultivator shanks, are vital elements of a cultivator utilized in soil preparation and weed management. These tynes are engineered to penetrate the soil effectively, facilitating the breakup and loosening of soil to enhance aeration and water infiltration. Additionally, they assist in uprooting weeds and preparing an optimal seedbed for planting. Cultivator tynes are attached to the main frame with heavy coil springs, allowing them to flex and spring back when encountering obstacles like stones or stumps

CULTIVATOR TINES

Product Code	Length (includes curvature)	Width	Thickness	Weight Per Piece with holes	Bend Type
	Inch	mm	mm	kg
